SOURCE: Elektrichestvo, no. 5, 1965, 90

TOPIC TAGS: electric engineering personnel, electric engineering

ABSTRACT: The article was written in honor of Lev Grazdanovich Mamikonyants on the occasion of his 50th birthday and upon his completion of 30 years of scientific and industrial activity. He graduated from the Azorbydzhan Industrial Institute in 1938, whereupon he worked at the Central Industrial Research Laboratory of Azenergo first as Electrical Engineer and then as Chief Engineer. His scientific activity begun during the student years at the university laboratories for electrical machinery and high-voltage techniques. From 1941 to 1945 he served in the Soviet Army and became a member of the Communist Party in 1942. Since 1945 he has been working with the VNIIE (All-Soviet Scientific Research Institute of Electric Power) at the State Industrial Commission on Power and Electrification of the USSR, in charge of the Electrical Machinery Laboratory now and also as head of the Department of Electrical Machinery, Insulation and Automation. Since 1953 he has also been the Vice-Director of the Institute of Scientific Affairs. He received the degree of Doctor of

ACC NR: AP6004792

4

Engineering Sciences in 1959 and was appointed Professor in 1961. Much theoretical and practical work has been done under his leadership at the Electrical Machinery Laboratory which he helped to set up. Problems concerning the theory of synchronous machines leading to their improved operation were worked out here (asynchronous condition after loss of excitation, simplified method of compensator starting, self-synchronization of generators, etc.). L. G. Mamikonyants is also active in scientific research coordinating committees on power and electrification in the USSR. He sits also on the Committee for the Determination of Electrical Equipment Parameters and on the Joint Scientific Council of the Moscow Power Institute. Furthermore, he is on the editorial board of Elektrichestvo. During his entire career he has published about 60 works, many of them resulting from basic research. At the Moscow Power Institute he taught a course on "Special Problems in Electric Power Stations" from 1952 to 1954 and on "Testing of Synchronous Machines" from 1953 to 1954. The texts of his lectures were printed in the form of a compendium. He is very effective in training the young generation of students and assisting them in earning their degrees. L. G. Mamikonyants participates in the activities of the VNIIE both as recruiter and as lecturer. Orig. art. has: 1 figure. [JPRS]

TITLE:

The Use of Vibration for Molding Ceramic Products by the  
Cast Method (Primeneniye vibratsii pri oformlenii  
keramicheskikh izdeliy metodom lit'ya)

PERIODICAL:

Steklo i keramika, 1959, Nr 6, pp 7-12 (USSR)

ABSTRACT:

The paper by Z. A. Nosova and T. Kh. Fedorova (NII  
Stroykeramika) states that the vibration for speeding up the  
molding of ceramic sanitary-building materials is suitable  
only in the case that pre-heated slime and pastes having a  
reduced content of aluminous components be used. Since quite  
a number of questions could not be solved in that  
investigation, the NII Stroykeramika carried through some  
investigations which are the subject of this article. The  
table shows the composition of the pastes employed. Soluble  
glass and calcinated soda have been added to the slime as  
diluting electrolytes. Investigations on the vibration effect  
have been undertaken on a vibrating plate designed by  
A. Ye. Desov and P. S. Kuznetsov (Footnote 1) and equipped  
with a mechanical drive of the type constructed by the

Card 1/3

The Use of Vibration for Molding Ceramic Products by the Cast Method SOV/72-59-6-2/13

engineers L. G. Brodskiy and A. A. Velikzhaninov of the PKB NII Stroykeramika. Amplitude and frequency of vibrations has been measured with the manual vibrograph VC-1. The authors refer in this respect to the papers by Yu. I. Iorish (Footnote 2). Figures 1 and 2 give information regarding the vibration influence on paste filtration. Professor V. A. Chernov recommended a method for determining the combined water content in the slime. Figure 3 shows that a reduction of the slime's initial moisture considerably slows down the filtration speed of all pastes investigated. According to the paper by A. V. Dumanskiy (Footnote 3) this is due to the reduction of the quantity of combined water in the initial suspension. The mechanical resistance of the molded piece immediately after extraction from the plaster mold has been determined according to the method of the Academician P. A. Rebinder with a conical meter for measuring plasticity designed by M. P. Volarovich and S. N. Markov, in which connection the authors of this article refer to the papers by I. A. Al'perovich, P. I. Berenshteyn, G. S. Blokh, I. K. Antonevich and I. M. Gorkova (Footnotes 4 and 5). The values

Card 2/3

The Use of Vibration for Molding Ceramic Products by SOV/72-59-6-2/18  
the Cast Method.

measured are summarized in figure 4. Figures 5 and 6 show the dependence of mechanical resistance on the vibration amplitudes. Conclusions: The influence of vibration increases the filtration speed only slightly and is practically of no influence on the general rate of moisture delivery. The use of the vibration method favors the moisture delivery thus reducing the residual moisture of the molded piece. The action of vibration increases the mechanical resistance of the molded piece which gives the possibility of using pastes having a reduced portion of aluminous components. This method allows molding of slimes having a temperature ranging between 40 and 60 centigrades. There are 6 figures, 1 table, and 5 Soviet references.

Smazki (Lubricants) Moscow, Standartgiz, 1960. 541 p. Errata slip inserted. 5,000 copies printed. (Series: Gosudarstvennyye standarty SSSR).

Ed.: M.L. Elkonina; Tech. Ed.: A. Ye. Matveyeva.

PURPOSE: This book is intended for mechanical engineers, industrial chemists, physicists, petroleum technicians, and other persons interested in the properties of lubricants.

COVERAGE: The book contains specifications and standards for lubricants, compiled by the "Standartgiz" State Publishing House (effective date - 1 March 1960). Current information on both new and revised standards and their revisions, which are published in the Informatsionnyy ukazatel' standartov (Reference Index of Standards), are also included. The specifications stipulate purpose, working conditions (especially temperature), composition, appearance and properties, minimum drip temperature (°C), penetration range at 25°C, corrosivity, thermostability, acid number, water content, and mechanical impurities content of lubricants.

TITLE: Stability of a closed, flexible, orthotropic, cylindrical shell when linear heredity is considered

SOURCE: Moscow. Universitet. Vestnik. Seriya 1. Matematika, mekhanika, no. 2, 1966, 112-119

TOPIC TAGS: orthotropic shell, shell structure stability, cylindric shell structure, fiberglass, elastic stress

ABSTRACT: Presented are detailed calculations of the stability of a closed, circular, axially stressed cylindrical shell of orthotropic fiberglass with a reinforcing linen crossweave. The constructed elastic solutions to the problem indicate that inclusion of linear heredity factors lowers the critical load values for fiberglass shells. Critical loads of shells from materials with linear heredity depend essentially on loading programs and increase as the rate of loading increases. Orig. art. has: 17 formulas and 2 figures.

The genesis of the plant cell. Ya. B. Pliengorn, I. E. Glushchenko, and A. S. Afanas'eva. *Doklady Akad. Nauk S.S.S.R.* 20, 241-4 (1951); *Chem. Zvest.* 1952, 604. — On the basis of expts. on animal material, Lepeshinskaya (cf. *Izvest. Akad. Nauk S.S.S.R., Ser. Biol.* 1930, No. 5, 102-9) has reported that cells do not necessarily arise from mother cells but may develop from material without cell structure. Accordingly, a similar study was undertaken with plant material. Observations reported on leaves of *Hedera helix* revealed not only a mitogenetic cell division but also a formation of new cells of another type involving splitting off or simple partition. Similar processes were observed in the increase in cells in potato tubers. The region of the potato in which cell increase was taking place by simple partition was neutral or slightly alk. in reaction, the remainder of the tuber showed an acid reaction. When plant fibers grow and develop a cell division and increase in the no. of cells are observed but mitogenetic processes are not always observed. M. G. Moore

Title : On some characteristics of the ontogenically young and differential cells

Periodical : Izv. AN SSSR. Ser. biol. 3, 87-95, May/Jun 1954

Abstract : Recognition of the cell as a unit of living matter focused attention on questions concerning its structure and the manner of its formation. Consequently the study of conditions accompanying formation and movement of noncellular matter within tissues of plants has attracted still greater attention more recently. The authors of this article examined noncellular matter during its various stages of development. They used the following plants in their experiments: *Allium odorum*, *Lilium tigrirum*, *Bryophyllum*, and *Hedra helix*. They discovered that rudimentary radicles found on the stem of *Hedra helix* consist of matter which has no cellular structure, and contain no nuclei: they are at the stage at which they begin to differentiate into cells each containing a nucleus. Comparative data of physicochemical properties of cells presented in a table. Illustrations. Ten references, one non-Soviet

TITLE: Use of surface-active additives for increasing the strength  
of the concrete in cooling towers

SOURCE: Beton i zhelezobeton, no. 1, 1967, 13-16

TOPIC TAGS: reinforced concrete, surface active agent

SUB CODE: 11

ABSTRACT: For the preparation of the concrete used in the construction of reinforced concrete cooling towers, the authors recommend the use of low-aluminate portland cement with an addition of not over 10 percent active hydraulic agent in order to guarantee longer service life for the towers. For the necessary increase in the frost-resistant quality of these concretes, the authors recommend reducing the amount of hydraulic additive, increasing the quality of the mixing technology and improving the curing process by using additive No 7.

A description is given of tests conducted by the ORGENERGOSTROY Institute and the Moscow Construction Engineering Institute (MISI). Test data on the use of additive No 7 are discussed and tabulated. Orig. art. has: 2 figures and

TITLE: New Data on Geological Structure and Formation of the  
Northern Part of the Aksubayevo-Melekess Depression  
(Novyye dannyye o geologicheskoy stroenii i istorii  
formirovaniya severnoy chasti Aksubayevo-Melekesskoy  
depressii)

PERIODICAL: Uch. zap. Kazansk. un-ta, 1956, Vol 116, Nr 5, pp 194-  
197

ABSTRACT: The Aksubayevo depression lies between the Tatarsk  
and Tokmovo anticlines. Along the lower levels of the  
Devonian period, it passes, to the north, into the  
narrow meridional Kazan flexure, and to the northeast,  
into the Zayinsk-Saraylinskiy progib (flexure), which  
divides the north and south extensions of the Tatarsk

Card 1/2

New Data on Geological Structure (Cont.)

15-57-8-11387

dome. Along the Schwagerina level, to the west, the depression is bounded by a steep monocline, complicated by the Pichkasskaya and Bugry struktury (structures), while its eastern border is complicated by terrace-like steps. The contours of the Aksubayevo depression coincide on all levels and are in good conformity with the gravity map. The Aksubayevo-Melekess depression is basically of post-Permian age. Oil accumulation traps are believed to exist in the lower Frankian, Givetian, and Visean zones on the western border. Permian bituminous developments along the periphery of the depression are favorable indications of the existence of petroleum deposits in the Carboniferous and Devonian on the western border.
